

The Effects of X on Y: A Fake Psychological Study

John Doe

August 29, 2024

Abstract

This study investigates the effects of X on Y using a sample of 100 participants. Various statistical analyses, including ANOVA, t-tests, and chi-square tests, were conducted to determine the significance of the results. Our findings suggest a significant impact of X on Y.

1 Introduction

The introduction provides an overview of the study and the theoretical background that motivated the research. Previous studies have shown that X influences Y, but the mechanisms remain unclear.

2 Method

2.1 Participants

A total of 100 participants (50 male, 50 female) were recruited for this study.

2.2 Procedure

Participants were randomly assigned to one of two conditions (Condition A and Condition B). They were then asked to complete a series of tasks designed to measure Y.

3 Results

3.1 ANOVA

An ANOVA was conducted to compare the effects of Condition A and Condition B on Y. The results showed a significant effect, $F(1, 98) = 6.23, p = 0.014$.

3.2 t-test

A t-test was conducted to compare the means of Condition A and Condition B. The results indicated a significant difference, $t(98) = 2.45, p = 0.016$.

3.3 Chi-Square Test

A chi-square test was conducted to examine the relationship between Condition and a categorical variable. The results were significant, $\chi^2(1) = 4.12, p = 0.042$.

4 Discussion

The results of this study suggest that X significantly affects Y, as evidenced by the ANOVA, t-test, and chi-square test results. These findings contribute to the existing literature by providing further evidence of the impact of X on Y.

5 Conclusion

In conclusion, this study highlights the importance of considering X when examining Y. Future research should explore the underlying mechanisms that drive this effect.
